

SmartStorageControl

Reinvention of the pick-per-light

- Ground-breaking component handling in electronics manufacturing
- Flexible assembly on all existing shelving, picking and transport trolleys as well as feeder storage systems
- Storage on shelves with the available places immediately in view
- Outsourcing from the shelves: picking of production orders with route-optimisation, individual orders or multi-order jobs
- Order picking set-up transport trolley: mobile transport trolley equipped with battery supply, ideal order picking, followed by an automatic conversion into a mobile SMD shelf for the set-up-optimised provision to the SMD picker and/or feeder trolley; mobile THT shelf equipped with a mini display per THT box for order-related production information
- Feeder storage system to guarantee the ideal handling of the equipped SMD feeders which are not needed on the SMD line; crossline availability check of feeders to guarantee an optimised use by taking into account current production orders
